

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

Coast Flora, 1881. Distinguished from other species by the more rounded long-petiolate leaves, which, as well as the bracts, are mainly in pairs instead of ternate (as occurs more or less frequently in some other species), by the closely sessile and unequally parted involucre, and by the yellowish flowers; in all other respects according with the generic character, thus increasing the accepted species of the genus to eight.

The Bulbs of *Epilobium palustre*.—Those who wish to see the bulbs of *Epilobium palustre*, L. (the *E. squamatum* of Nuttall) may find them in moist low grounds when they first appear in spring. Later, the fleshy scales of the bulbs decay and disappear. In autumn, they are found at the ends of slender stolons attached to the parent root. They are then about an inch long, of a dusky flesh-color, the scales regularly overlapping each other along the axis of growth, with the bud at the end. The roots spring from between the scales, and, as the latter decay as soon as their nutriment is absorbed by the growing plant, there are no bulbs to be seen by the time the flowers appear. The same bulbs appear on *E. molle*, Torr., and possibly on all the rest of the family.

LUCY A. MILLINGTON.

Distribution of Weeds.—Among the means whereby weeds are distributed, their being generally objectionable to cattle should not be overlooked. When in North Carolina, I noticed that wherever *Verbesina Siegesbeckia* had to struggle unaided with other native vegetation there were only plants here and there among scores of other species of vegetation. When it was growing in a pasture or along the roadside where cattle ate, it soon took possession of the whole surface, simply because cattle kept other species from seeding, while avoiding this, and thus it had the whole ground to itself. It is very often an argument that an introduced plant is better adapted to the new location than the native, because it seems to spread so rapidly; but in most cases it may be because cattle will not touch it, and there happen to be few other competitors of its class. It gets the whole field to itself. The ox-eye daisy and the buttercup spread so amazingly quite as much because cattle let them go to seed as that the climate or soil is unusually favorable. Around our large cities, *Stramonium*, wild chamomile, Canada thistle, wormseed and other well-known weeds spread only because goats, sheep, cows and geese avoid them, and they have thus nothing to interfere with their rapid spread. These remarks are suggested by an idea thrown out in a foreign periodical I have just been reading, that the great spread of some European weeds in America is a proof that they have found a soil and climate superior to those "for which they were specially created."

THOMAS MEEHAN.

New Species of Ferns.—In our next number, Prof. D. C. Eaton will describe some new United States ferns, give new stations for a number of old species, and notice Prof. Lemmon's very interesting discoveries made last August in Arizona.
